Submitted (MAR-1994) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: MRS4 SUPPRESSES A MITOCHONDRIAL SPLICE DEFECT IN THE FIRST INTRON OF THE COB GENE. IT MAY ACT AS A CARRIER, EXERTING ITS SUPPRESSOR ACTIVITY VIA WOULLATION OF SOLUTE CONCENTRATIONS IN THE MITOCHONDRION (POSSIBLY OF CATIONS). NOT ESSENTIAL.
-!- SWBCELLULAR LOCATION: Integral membrane protein. Mitochondrial

   "Identification in Saccharomyces cerevisiae of two isoforms of a novel
                                                                                    membranes of mitochondria. Can transport 2-oxoadipate, 2-oxoadipate, 2-oxoadirante, adipate, glutarate, 2-oxoadipate, 2-oxoadipate, 2-oxoadipate, oxaloadise, oxaloadise, citrate and malate. The main physiological role is probably to supply 2-oxoadipate and 2-oxoglutarate from the mitochondrial matrix to the cytosol where they are used in the blosynthesis of lysine and glutamate, respectively, and in lysine catabolism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               11 RYRNVLEALWRIIRTEGLWRPMRGLNVTATGAGPAHALYFACYEKLKKTLSDVIHPGGNS 70

Submitted (MAR-2001) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Responsible for the uptake of deoxynucleotides into the matrix of the mitochondria. Transports all four deoxy NDPS, and, less efficiently, the corresponding dNTPs. Does not transport dNMPS, NMPS, MAPS, deoxynucleosides, nucleosides, purines, or pyrimidines. Supply deoxynucleotides to the mitochondrial matrix for conversion to triphosphates and incorporation into mitochondrial DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DOMAIN: COMPOSED OF THREE HOMOLOGOUS DOMAINS.
DISEASE: Likely to be medically important by providing the means of uptake into mitochondria of nucleoside analogs, leading to the mitochondrial impairment that underlies the toxic side effects of such drugs in the treatment of viral illnesses, including AIDS,
                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Dolce V., Fiermonte G., Runswick M.J., Palmieri F., Walker J.E.; "The human mitochondrial deoxynucleotide carrier and its role in the

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
